## MobaXterm

Enhanced terminal for Windows with X11 server, tabbed SSH client, network tools and much more

Syntax highlighting: highlight important words when browsing large text portions

 GET MOBAXTERM NOW!

### MobaXterm X server and SSH client

MobaXterm is your **ultimate toolbox for remote computing**. In a single Windows application, it provides loads of functions that are tailored for programmers, webmasters, IT administrators and pretty much all users who need to handle their remote jobs in a more simple fashion.

MobaXterm provides all the important **remote network tools** (SSH, X11, RDP, VNC, FTP, MOSH, ...) and **Unix commands** (bash, ls, cat, sed, grep, awk, rsync, ...) to Windows desktop, in a **single portable exe file** which works out of the box. [More info on supported network protocols](#)

### Key features

-  **Embedded X server**  
Fully configured Xserver based on X.org
-  **Easy DISPLAY exportation**  
DISPLAY is exported from remote Unix to local Windows
-  **X11-Forwarding capability**  
Your remote display uses SSH for secure transport
-  **Tabbed terminal with SSH**  
Based on PuTTY with antialiased fonts and more support

E non c'è #wsgarr senza ☁️! Il 10 ottobre parliamo della #Cloud GARR, di servizi, modelli e casi d'uso con Enzo Ludovici @unimib, Davide Vaghetti e Claudio Pisa @ReteGARR Federico Zani @INFN\_, Giuseppe Vallone @UniPadova. Ci vediamo a @UnivRoma3! 🗨️ [garr.it/ws19](https://garr.it/ws19)

# Access to computational resources

## *Security is an issue*

Public key authentication is a way of logging into an **SSH/SFTP** account using a cryptographic key rather than a password

- Keys come in pairs of a **public key** and a **private key**. Each key pair is unique, and the two keys work together.
- These two keys have a very special and beautiful mathematical property: if you have the private key, you can prove you have it without showing what it is. It's like proving you know a password without having to show someone the password.
- Public key authentication works like this:
  - (1) Generate a key pair.
  - (2) Give someone (or a server) the public key.
  - (3) Later, anytime you want to authenticate, the person (or the server) asks you to prove you have the private key that corresponds to the public key.
  - (4) You prove you have the private key.

# RSA algorithm

encryption is based upon factorization of integers as a product of prime numbers:  
a complex computational problem

## Key generation

- Choose two distinct primes  $p$  and  $q$  of approximately equal size so that their product  $n = pq$  is of the required bit length.
- Compute  $\phi(n) = (p - 1)(q - 1)$ .
- Choose a public exponent  $e$ ,  $1 < e < \phi(n)$ , which is coprime to  $\phi(n)$ , that is,  $\gcd(e, \phi(n)) = 1$ .
- Compute a private exponent  $d$  that satisfies the congruence  $ed \equiv 1 \pmod{\phi(n)}$ .
- Make the public key  $(n, e)$  available to others. Keep the private values  $d, p, q$ , and  $\phi(n)$  secret.

semi-prime number: product of two prime numbers

In order to break it, they would have to find the prime factorization of the large semi-prime number – that is, two or more **prime numbers** that multiplied together result in the original number.

\*To make factoring harder,  $p$  and  $q$  should be chosen at random, be both large and have a large difference

# SSH troubles

—I had a problem connecting to older devices, and I made it work in Ubuntu 22.04 with OpenSSH 8.9 / OpenSSL 3.0.2 by adding the following lines in the Host section of /etc/ssh/ssh\_config on the client side:

```
HostKeyAlgorithms +ssh-rsa  
PubkeyAcceptedKeyTypes +ssh-rsa
```

# Basic Rotation matrices

$$R_{z,\theta} = \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$R_{x,\theta} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta \\ 0 & \sin \theta & \cos \theta \end{bmatrix}$$

$$R_{y,\theta} = \begin{bmatrix} \cos \theta & 0 & \sin \theta \\ 0 & 1 & 0 \\ -\sin \theta & 0 & \cos \theta \end{bmatrix}$$

Complex rotations, *Euler representation*,  
right-multiply vectors, the order matters

$$R_z(\gamma) * R_y(\beta) * R_x(\alpha)$$

# Axis-angle representation

Every rotation in three dimensions is defined by its axis (a vector along this axis is unchanged by the rotation), and its angle — the amount of rotation about that axis

$$R = \begin{bmatrix} \cos \theta + u_x^2 (1 - \cos \theta) & u_x u_y (1 - \cos \theta) - u_z \sin \theta & u_x u_z (1 - \cos \theta) + u_y \sin \theta \\ u_y u_x (1 - \cos \theta) + u_z \sin \theta & \cos \theta + u_y^2 (1 - \cos \theta) & u_y u_z (1 - \cos \theta) - u_x \sin \theta \\ u_z u_x (1 - \cos \theta) - u_y \sin \theta & u_z u_y (1 - \cos \theta) + u_x \sin \theta & \cos \theta + u_z^2 (1 - \cos \theta) \end{bmatrix}$$

# Water molecule structure

O	0.000000	0.000000	0.000000
H	0.758602	0.000000	0.504284
H	0.758602	0.000000	-0.504284

- 1) find the molecule plane
- 2) rotate molecule w.r.t. y axis
- 3) compare structures

# Glycine structure

- 1) find the C $\alpha$ -C=O
- 2) find perpendicular axis
- 3) rotate and compare structures
